Such diseases include type I diabetes, type II diabetes, immune dysfunction, AIDS, autoimmunity, glucose intolerance, obesity, cancer, psoriasis, allergic diseases, infectious diseases, inflammatory diseases, diseases involving the modulated synthesis of growth hormone or the modulated synthesis of growth factors or cytokines which affect the production of growth hormone, or Alzheimer's disease.

BETA-CARBOLIN DERIVATIVES AS PTP-INHIBITORS

Statement of Related Applications

The present application claims priority under 35 USC 119 from the following US Provisional Applications: Serial Number 60/346,125, filed October 19, 2001, entitled "Heteroaryl-Fused Nitrogen Heterocycles as Therapeutic Agents"; Serial Number 60/346,176, filed October 19, 2001, entitled "Heteroaryl-Fused Heterocyclic Aminoamide Derivatives as Therapeutic Agents", the entirety of which are herein incorporated by reference.

Field of the Invention

This invention relates to compounds which are inhibitors of protein tyrosine phosphatases (PTPases), which are useful for the management, treatment, control, or adjunct treatment of diseases caused by over-activity of PTPases.

Background of the Invention

The process of protein phosphorylation is now recognized as central to the fundamental processes of cellular signal transduction. Alterations in protein phosphorylation, may therefore constitute either a physiological or pathological change in an *in vivo* system. Protein de-phosphorylation, mediated by phosphatases, is also central to certain signal transduction processes.

The two major classes of phosphatases are (a) protein serine/threonine phosphatases (PSTPases), which catalyze the dephosphorylation of serine and/or threonine residues on proteins or peptides; and (b) the protein tyrosine phosphatases (PTPases), which catalyze the dephosphorylation of tyrosine residues on proteins and/or peptides. A third class of phosphatases is the dual specificity phosphatases, or DSP's, which possess the ability to act both as PTPases and as PSTPases.

Among the PTPases there exist two important families, the intracellular PTPases, and the transmembrane PTPases. The intracellular PTPases include PTP1B, STEP, PTPD1, PTPD2, PTPMEG1, T-cell PTPase, PTPH1, FAP-1/BAS, PTP1D, and PTP1C. The transmembrane PTPases include LAR, CD45, PTP α , PTP β , PTP δ , PTP ϵ , PTP ξ , PTP κ , PYP μ , PTP σ , HePTP, SAP-1, and PTP-U2. The dual – specificity phosphatases include KAP, cdc25, MAPK phosphatase, PAC-1, and rVH6.

The PTPases, especially PTP1B, are implicated in insulin insensitivity characteristic of Type II diabetes (Kennedy, B.P.; Ramachandran, C. *Biochem. Pharm.* 2000, 60, 877-883). The PTPases, notably CD45 and HePTP, are also implicated in immune system

function, and in particular T-cell function. Certain PTPases, notably TC-PTP, DEP-1, SAP-1, and CDC25, are also implicated in certain cancers. Certain PTPases, notably the bone PTPase OST-PTP, are implicated in osteoporosis. PTPases are implicated in mediating the actions of somatostatin on target cells, in particular the secretion of hormone and/or growth factor secretion.

Thus, there is a need for agents which inhibit the action of protein tyrosine phosphatases. Such agents would be useful for the treatment of Type I diabetes, Type II diabetes, immune dysfunction, AIDS, autoimmunity, glucose intolerance, obesity, cancer, psoriasis, allergic diseases, infectious diseases, inflammatory diseases, diseases involving the modulated synthesis of growth hormone or the modulated synthesis of growth factors or cytokines which affect the production of growth hormone, or Alzheimer's disease.

Summary of the Invention

This invention provides heteroaryl-fused nitrogen heterocycles which are useful as inhibitors of PTPases. The present invention provides compounds of Formula (I) as depicted below, methods of their preparation, pharmaceutical compositions comprising the compounds and to their use in treating human or animal disorders. The compounds of Formula (I) are useful as inhibitors of protein tyrosine phosphatases and thus are useful for the management, treatment, control and adjunct treatment of diseases mediated by PTPase activity. Such diseases include Type I diabetes, Type II diabetes, immune dysfunction, AIDS, autoimmunity, glucose intolerance, obesity, cancer, psoriasis, allergic diseases, infectious diseases, inflammatory diseases, diseases involving the modulated synthesis of growth hormone or the modulated synthesis of growth factors or cytokines which affect the production of growth hormone, or Alzheimer's disease.

Intermediate (4) in Scheme I may be prepared by employing a cyclization/condensation procedure as described in Chemical Reviews, (1995), 95, 6. Treatment of (1) with an aldehyde R_1 -CHO in dichloromethane in the presence of TFA at a temperature ranging from -78°C to 50°C affords the fused heterocyclic system (2). PG_2 may be hydrogen or a lower alkyl group or other suitable ester protecting group. (2) may be protected at N-2 giving (2) by methods known in the art. For example, treatment of (2) with di-tert-butyl dicarbonate and a weak base such as sodium bicarbonate in an aqueous organic solvent such as THF affords the N-2-tert-butyl carbamate (3), where PG_1 is $-\text{C}(\text{O})\text{-O-t-Bu}$. PG_2 may be removed by suitable methods known in the art. For example, where PG_2 is a simple alkyl group such as methyl, ethyl, etc, treatment of (3) with aqueous alkali followed by neutralization with weak acid affords (4).

Where higher reaction temperatures are employed, such as temperatures of from 25°C to 100°C, the trans isomer (4t) may be formed in preference to the cis (4c) (Scheme 2).

General Experimental

LC-MS data was obtained using gradient elution on a Waters 600 controller equipped with a 2487 dual wavelength detector and a Leap Technologies HTS PAL Autosampler using an YMC Combiscreen ODS-A 50x4.6mm column. A three minute gradient was run from 25% B (97.5%acetonitrile, 2.5% water, 0.05% TFA) and 75% A (97.5% water, 2.5% acetonitrile, 0.05% TFA) to 100% B. The mass spectrometer used was a Micromass ZMD instrument. All data was obtained in the positive mode unless otherwise noted.

Procedure A

1 equivalent of amine methyl ester and 1.1 equivalent of aromatic or aliphatic aldehyde is suspended in anhydrous toluene (0.1-0.5M). The reaction mixture is refluxed for 6-8 hours over activated molecular sieves (4 Angstrom) with an excess of TFA (~ 2.5 equivalents). When the cyclization is complete, the reaction mixture is poured into ice water and neutralized to basic with an excess of aqueous NaOH. The aqueous layer is further extracted with EtOAc, the organic layers combined, washed with brine, and the organic layer dried over sodium sulfate. The solvent is removed *in vacuo* and the crude product purified

Procedure C

 1 equivalent of amine methyl ester and 1.1 equivalent of aromatic or aliphatic aldehyde is suspended in anhydrous dichloromethane (0.1-0.5M). The reaction mixture is stirred for 6 hours at 0° C to -70° C, with a trace of TFA (< 5 mole%) over activated
20 molecular sieves (4 Angstrom). After complete formation of imine, an excess of TFA (~ 2.5 equivalents) is added and reaction is continued for further 9-12 hours at 0 to -70° C. When the cyclisation is complete, the reaction mixture is poured into ice water and made basic with an excess of aqueous NaOH. The aqueous layer is further extracted with dichloromethane, the organic layers combined, washed with brine, and the organic layer dried over sodium
25 sulfate. The solvent is removed *in vacuo* and the crude product purified by flash chromatography on silica gel to give the final product, which is typically a mixture of cis and trans. The two isomers may be separated through silica column chromatography, elution with hexane: ethyl acetate.

Procedure D: Protection of amino ester

30 1 equivalent of amino ester is suspended in anhydrous THF or dioxane (0.1-0.5 M), to which was added 1.4 equivalents of DIEA or Na₂CO₃ and 1.5 equivalents of di-*tert*-butyl-dicarbonate. The mixture is stirred for 6 hours and diluted with water and the layers were separated. The aqueous layer is further extracted with EtOAc, the organic layers combined, washed with brine, and the organic layer dried over sodium sulfate. The solvent is removed

in vacuo, and the crude product purified by to flash chromatography on silica gel to give the final product.

General Procedure E: Hydrolysis of Protected ester

5 The ester (1 equivalent) is suspended in a mixture of MeOH:THF:H₂O (1:1:1 ; 0.1-0.2 M). LiOH (10-15 eq) is added and the mixture stirred at 40 °C for 3-6 hours. The solution is acidified with 10% citric acid, and extracted with ethyl acetate. The organic extracts are combined, washed with brine, dried over Na₂SO₄, and the solvent removed *in vacuo*. The residue is purified by silica gel chromatography to yield the final compound.

10 Procedure F: Coupling of Carboxylic Acid and Amine

 To a solution of carboxylic acid (1.25 equivalents) in DMF (0.1-0.5 M), HBTU (1.25 equivalents) is added followed by DIEA (1.25 equivalents) and the appropriate amine (1 equivalent). The reaction mixture is then stirred at room temperature for 2-4 hours, and is diluted with water/EtOAc and the layers separated. The aqueous layer is re-extracted with
15 EtOAc and the organic layers combined, washed with saturated Na₂CO₃ and brine. The organic phase is then dried over Na₂SO₄, filtered, and the filtrate is concentrated and purified by silica gel chromatography to afford the amide derivative.

Procedure G: Removal of the Boc-Protecting group

 The protected compound is stirred in 4N HCl/dioxane for 1 hour. The solvent
20 removed, and the product triturated several times with ether to afford the desired compound.

Procedure H: Hydrolysis of Nitrile

 The nitrile (1 equivalent) is suspended in a mixture of 6 N HCl in aqueous media and the mixture is refluxed for 6-12 hours. The solution is neutralized and extracted with ethyl
25 acetate. The organic extracts are combined, washed with brine, dried over Na₂SO₄, and the solvent removed *in vacuo*. The residue is purified by silica gel chromatography to yield the final compound.

Procedure I: Synthesis of methyl ester

30 The carboxylic acid is stirred in 4N HCl/dioxane and methanol under reflux temperature for 4- 6 hours. The solvent is removed, and the product triturated several times with ether to afford the desired compound.

Procedure J: O-alkylation of aryl alcohol

35 To a solution of hydroxy compound (1 equivalent) in anhydrous DMF (0.8-.1.5 M) is added freshly ground K₂CO₃ (1.5 equivalents), followed by an alkyl or aryl halide (1:1

equivalents). The reaction mixture is stirred at 80° C for 2-6 hours, it was diluted with water/EtOAc and the layers separated. The aqueous layer is further extracted with EtOAc and the organic layers combined and dried over Na₂SO₄. The solvent is removed *in vacuo* and the residue is purified by silica gel chromatography to yield the final product.

5 Procedure K: Reduction of methyl ester

A solution of methyl ester compound (1 equivalent) in anhydrous THF (0.8-.1.5 M) is cooled to 0° C, and is treated with DIBAL-H in THF solution (2.0 equivalents). The reaction mixture is stirred at 0° C for 2-4 hours, quenched, and treated with saturated Na₂SO₄ solution and diluted with water/EtOAc and the layers separated. The aqueous layer is
10 further extracted with EtOAc and the organic layers combined and dried over Na₂SO₄. The solvent is removed *in vacuo* and the residue is purified by silica gel chromatography to yield the final product.

Procedure L: Formation of keto ester

1 equivalent of a protected amino acid is dissolved in anhydrous DMF (0.2-0.3 M), to
15 which is added DIEA (1 equivalent) and either 1 equivalent of a bromo- or chloro-ketone. The mixture is stirred at room temperature for 30 minutes, diluted with water/ethyl acetate and the layers separated. The aqueous layer is further extracted with EtOAc. The organic layers are combined, washed with saturated citric acid, brine, and the organic layer dried over Na₂SO₄, and the solvent is removed *in vacuo* to give the crude product, which is used
20 without further purification.

Procedure M: Oxidation of alcohol

To a solution of alcohol (1 equivalent) in anhydrous dichloromethane (0.8-.1.5 M) is cooled to 0° C and is added pyridinium dichromate (2.0 equivalents). The reaction mixture is stirred at room temperature for 6-8 hours. The reaction mixture is diluted with water/EtOAc
25 and the layers separated. The aqueous layer is further extracted with EtOAc and the organic layers combined and dried over Na₂SO₄. The solvent is removed *in vacuo* and the residue purified by silica gel chromatography to yield the final product.

PTP1B ASSAY

25

The assay for PTP1B inhibition is based on the detection of the complex between Malachite Green dye and free phosphate, liberated from the phosphopeptide substrate by PTPase action. To each well of a flat – bottom assay plate is added 45µL assay buffer [- 50 mM Imidazole, pH 7.2, 100 mM NaCl, 5 mM DTT, and 1 mM EDTA] and 10 µL of peptide substrate [Tyrosine Phosphopeptide –1, END(_pY)INASL, 80 µM FAC, Promega Cat # V256A] to a total volume of 55 µL. Test compound (10 µL in up to 50% DMSO) is then added. The mixture is incubated for 5 min, at 25°C, and 10 µL of PTP-1B [Protein Tyrosine Phosphatase 1B (PTP-1B); FAC 0.8 nM; Upstate Biotechnology, Cat # 14-109 lot # 19045] is then added. The mixture is incubated for 30 min at 25 °C. Subsequently, 25 µL of Malachite Green reagent [10% (w/v) Ammonium Molybdate in water, Sigma Cat # A-7302, 0.2 % (w/v) Malachite Green in 4 N HCl, Aldrich Cat # 21,302-0] is then added. After incubation for 15 min at 27°C, the reaction endpoint is measured at 640 nM.

30

35

The Malachite Green reagent is prepared by mixing one volume of 10% Ammonium Molybdate with 3 volumes of 0.2% Malachite Green solution, stirring at room temperature for 30 min and then filtering and collecting the filtrate. The Malachite Green reagent is treated with 10 μ L of 5% Tween 20 per 990 μ L of dye solution before use.

To each well of a flat – bottom assay plate is added 45 μ L assay buffer [- 50 mM Imidazole, pH 7.2, 100 mM NaCl, 5 mM DTT, and 1 mM EDTA] and 10 μ L of peptide [Tyrosine Phosphopeptide –1, END ($_p$ Y) INASL at $k_m = 80 \mu$ M FAC; Promega Cat # V256A] to a total volume of 55 μ L. The test compound (10 μ L in up to 50% DMSO) is then added. The mixture is incubated for 5 min at 25°C, and 10 μ L of 1 nM T-cell PTPase (CalBiochem) is then added. The mixture is incubated for an additional 30 min at 25°C. Subsequently, 25 μ L of Malachite Green reagent [10% (w/v) Ammonium Molybdate in water; Sigma Cat # A-7302; 0.2 % (w/v) Malachite Green in 4 N HCl; Aldrich Cat # 21,302-0] is then added. After incubation for 15 min at 27°C, the reaction endpoint is read at 640 nM.

20

The Malachite Green reagent is prepared by mixing one volume of 10% Ammonium Molybdate with 3 volumes of 0.2% Malachite Green solution, stirring at room temperature for 30 min and then filtering. The Malachite Green reagent is treated with 10 μ L of 5% Tween 20 per 990 μ L of dye solution before use.

INTERNATIONAL SEARCH REPORT

Inter national application No.
PCT/US 02/33520

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claims may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, a meaningful search over the whole breadth of the claims is impossible. Consequently, the search has been restricted to compounds of formula (I) in which

R1 designates a homo or heterocyclic group and

A2 designates a group O-L-Cyc or N-L-Cyc wherein

L designates a direct bond or 1-2 C-atoms and

Cyc designates a homo- or heterocyclic moiety

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
